

BAM SECURITY WEBSITE

Professional User & Administration Manual

BLUE EDITION • VERSION 1

A complete, plain-language guide to the public website, member portal, digital membership IDs, QR verification, events, documents, website editing and administration.

Prepared for: Bouncer Association of Meghalaya (BAM)

Edition: Professional Blue Edition

Software: BAM Security Website Version 1

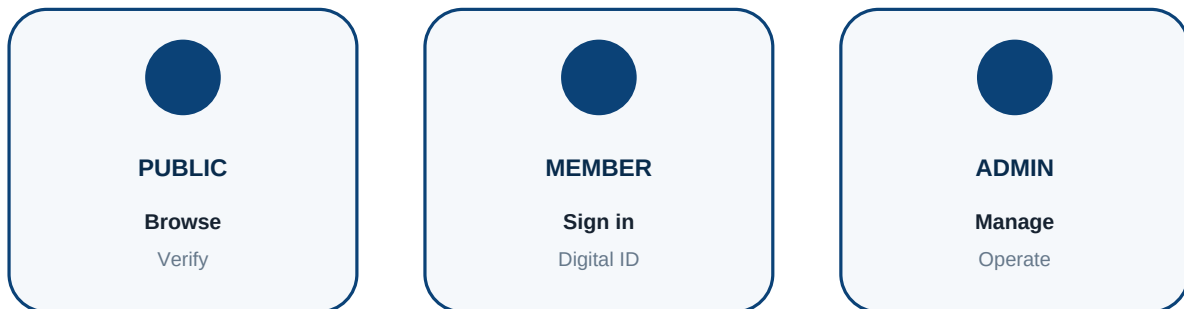

Audience: Public users, BAM members, administrators and site operators

DESIGNED TO BE READ BY A NON-TECHNICAL USER

WELCOME TO THE BAM SYSTEM

This manual is more than a list of buttons. It explains **what each part of the system is for, who should use it, what to enter, what happens after you save, and what to check if something goes wrong.**

The easiest way to understand BAM is to think of it as three connected layers:

Public website → tells the BAM story and provides verification.

Member area → gives a member access to their digital identity.

Admin area → maintains the records and produces the organisation's operational documents.

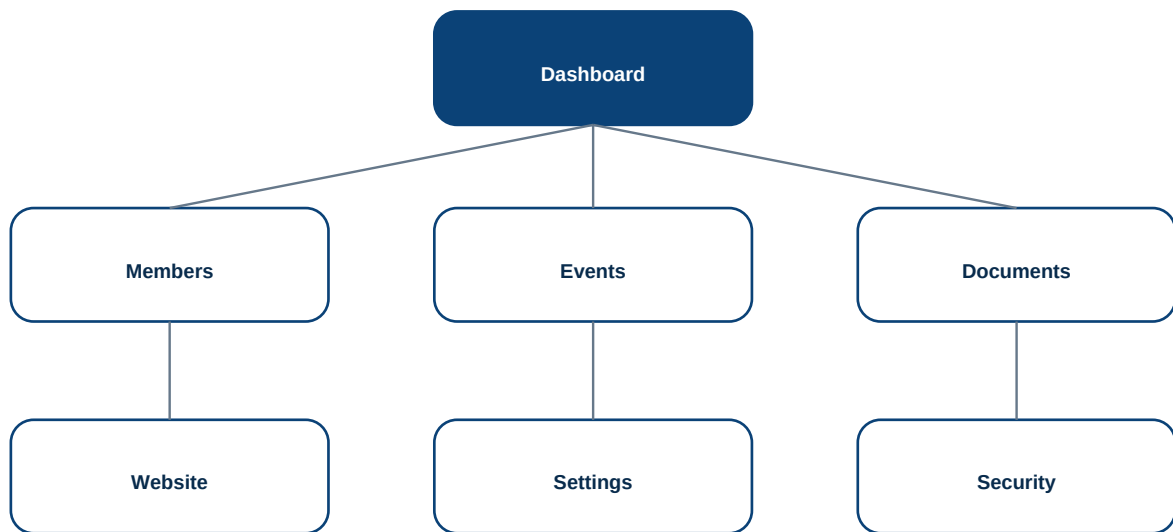

A simple rule: the member record is the source of truth. When a member's name, designation, photo, status or validity changes, update the member record first. The digital ID and verification functions use that information.

How to use this manual

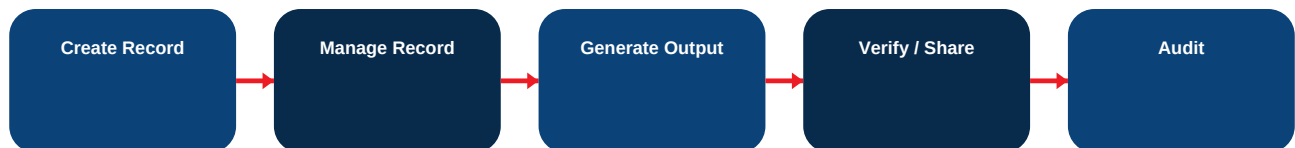

- Start with the **Quick Start** if you are new.
- Use the **Admin SOP** chapters when doing day-to-day work.
- Use **Troubleshooting** when a screen or function does not behave as expected.
- Use **Security & Backup** before changing the server or database.

1 • SYSTEM AT A GLANCE

The Version 1 platform brings the public website and operational tools into one system.

The core journey

The same information can travel through several parts of the system. For example: a member is created → the member receives a digital ID → the ID contains a QR code → a third party scans it → the verification page reads the member record → the administrator can later review changes in the audit trail.

Think of the Admin panel as the control room. The public website is the reception desk. The member portal is the member's personal counter.

2 • QUICK START FOR FIRST-TIME USERS

If you have never used the BAM website before, follow the path that matches your role.

PUBLIC VISITOR

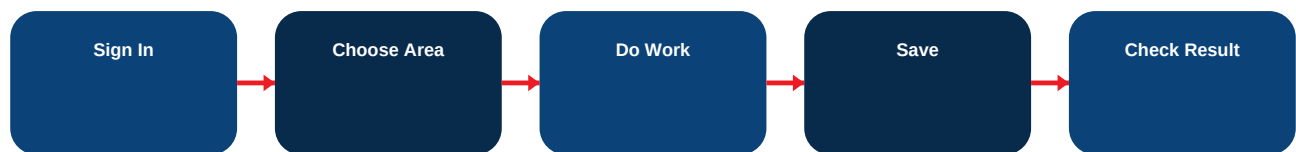

1. Open the BAM website.
2. Read the organisation information.
3. Open Services, Capabilities or Gallery when you need background information.
4. Use Contact when you need to communicate with BAM.
5. Use Verify Member when you need to check a BAM digital ID.

BAM MEMBER

1. Open Member Login.
2. Enter your BAM Member ID and password.
3. Open the digital ID from the member dashboard.
4. Print or save the ID as PDF if needed.
5. If the ID information is wrong, contact the administrator rather than editing public information yourself.

ADMINISTRATOR

1. Open `/admin/login.php`.
2. Sign in using the administrator email address and password.
3. Use Dashboard to choose Members, Events, Invoices, Letters, Website Editor, Settings or Audit.
4. Save changes.
5. Check the public-facing result when the change affects the website, ID or verification.

3 • PUBLIC WEBSITE

The public website is the outward-facing side of BAM. It is designed to work on desktop, tablet and mobile screens.

PUBLIC SECTIONS

- **Home:** first impression and primary BAM message.
- **About:** organisation information.
- **Services:** communicates security-related services.
- **Capabilities:** explains operational capability and experience.
- **Gallery:** shows BAM activity and imagery.
- **Contact:** provides communication channels.
- **Verify Member:** public member verification.

BAM in the field

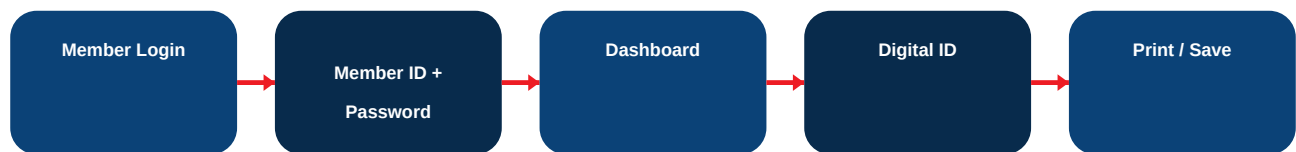

Project imagery can be used in the manual as a visual identity element.

The supplied project includes responsive behaviour, SEO metadata, canonical/OG metadata, a first-render skeleton/loading experience and day/night visual theme support.

For the public user, the site should feel simple: **read** → **understand** → **contact** → **verify**.

4 • MEMBER LOGIN & DIGITAL ID

A member does not need access to the Admin panel. The member area is deliberately simpler.

MEMBER LOGIN

Open </member/login.php>. Enter the BAM Member ID and password, then select Sign In.

DIGITAL ID

The ID is generated from the member record and the Digital Membership ID settings. Depending on configuration it may include the member ID, name, designation, photo, validity, status and QR verification information.

Digital Membership ID

If the ID is wrong, do not try to fix the printed/PDF copy. Correct the member record and regenerate/reopen the ID.

5 • PUBLIC MEMBER VERIFICATION

Verification answers one simple question: **Does this digital BAM membership record correspond to a record in the BAM system?**

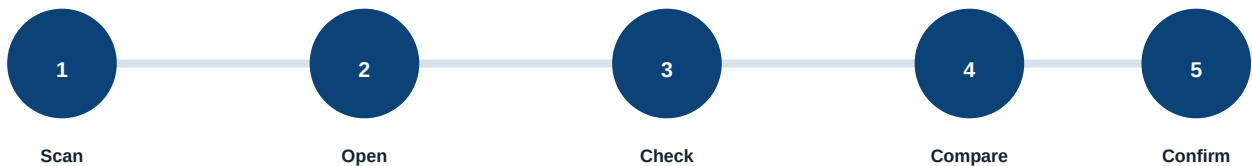

QR VERIFICATION

- 1 Scan the member ID
- 2 Open the verification page
- 3 Review the public fields

Only fields marked Public QR are exposed.

QR WORKFLOW

The verification page is connected to the MySQL member database. Publicly visible fields are controlled by the administrator. The project includes support for Member ID search and configurable verification messages.

PRIVACY CHECK

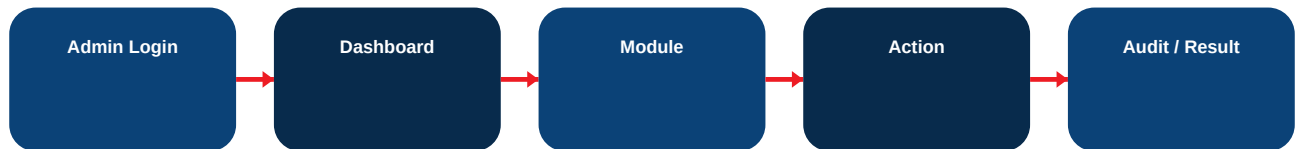

The **Public QR** control should be treated as a privacy gate. If a field is not intended for public viewing, do not enable it for public verification.

6 • ADMIN LOGIN & DASHBOARD

The Admin panel is the operating centre of BAM. It is intended for authorised administrators.

LOGIN FACT

Version 1 uses the administrator **email address** for login. The administrator account is created during installation or later from the Administrators section.

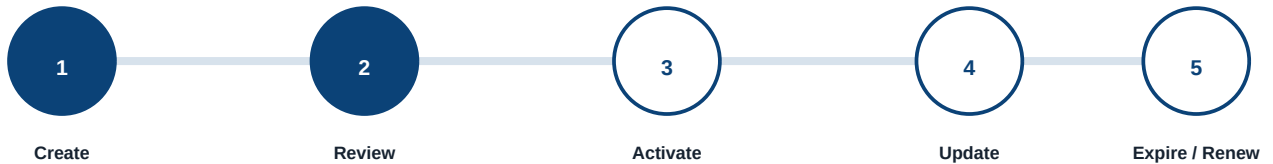

The Admin navigation includes Dashboard, Members, Events, Invoices, Letters, Frontend Editor, ID Fields, Settings, Administrators, Audit and notification/PWA functions.

Password show/hide controls are available on the login and administrator screens. Version 1 specifies a minimum administrator password length of 4 characters; a longer, unique password is recommended for real deployment.

7 • MEMBER MANAGEMENT

Member Management is the heart of the identity system.

MEMBER LIFECYCLE

CREATE A MEMBER

Go to **Admin** → **Members** → **Add Member**. Complete the identity information and save the record.

Typical fields include Member ID, Full Name, Designation, Phone, Email, Status, Address, Events/Assignment, Joined Date, Valid Until, Member Login Password, Photo, Custom Fields and Internal Notes.

QUALITY CHECK BEFORE SAVE

- ✓ Member ID is unique and correctly typed
- ✓ Name matches official records
- ✓ Designation is correct
- ✓ Photo is clear and current
- ✓ Status is correct
- ✓ Valid-until date is correct
- ✓ Any public-facing fields have been reviewed

AFTER SAVE

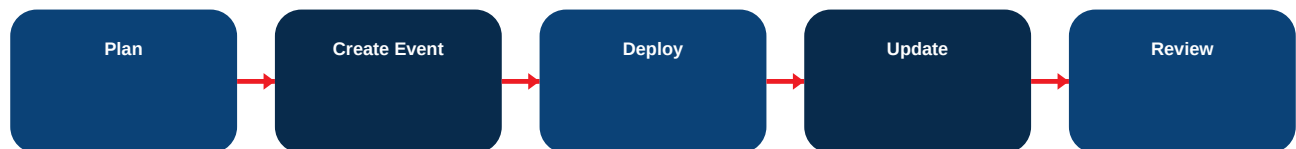

Open the digital ID. Confirm the member's name, photo, designation, validity and QR behaviour. If everything is correct, the member record is ready for operational use.

8 • EVENTS & OPERATIONS

Events are used to record BAM operational assignments and the information needed to manage them.

EVENT RECORD

Event Name • Event Type • Organizer / Client • Venue / Location • Event Date • Status • Start Time • End Time • Personnel Required • Personnel Deployed • Operational Notes

A useful practice is to create the event before deployment, then update the personnel deployed and operational notes after the assignment is underway or completed.

BAM Team & Operations

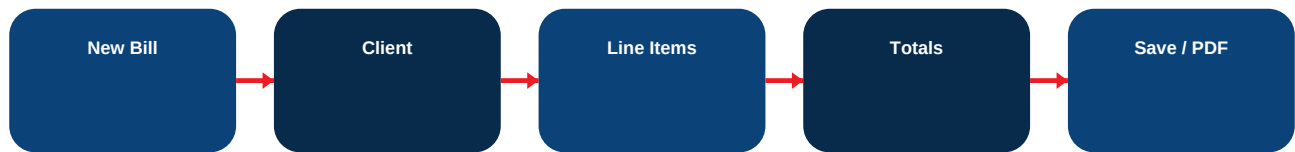

Use the Gallery and event content to keep the public story current.

Use Event History and filtering/search controls to locate older assignments when the list becomes large.

9 • INVOICES & BILLING

The invoice module produces official BAM bills that can be saved, reopened and printed/saved as PDF.

CREATE AN INVOICE

1. Open **Admin** → **Invoices** → **New Bill**.
2. Enter invoice number/date and client information.
3. Add services using **+ Add Item**.
4. Enter the rate for each item.
5. Add tax if applicable.
6. Set status and notes.
7. Select **Generate & Save Bill**.
8. Reopen the saved bill and check it before printing.

Official Invoice Template

BILL

Date: _____

Bill to: _____

Sl. No.	Particular	AMOUNT
		

THANK YOU!

📧 meghalaya_bouncer

 Junesta Kharbuli
 BAM

The invoice template and official details are controlled from Invoice Settings.

10 • OFFICIAL LETTERS

The Letters module turns routine correspondence into a controlled BAM document.

CREATE A LETTER

Enter the recipient, subject and body. Use the formatting toolbar for headings, bold, italic, lists, tables and other supported formatting. Add the closing/signatory information and save.

Before printing, read the letter once from top to bottom. Confirm recipient name, subject, date/number and signatory details.

11 • WEBSITE CONTENT EDITOR

The Frontend Editor is the place for content changes that should appear on the public website without editing PHP code.

CONTENT AREAS

Navigation • Contact Channels • Homepage Hero • About / Why BAM • Services • Capabilities • Events / Timeline • Gallery • Images / Logos • Colours / Typography • SEO Title / Description

Public Gallery Example

Best practice: make a small group of related edits, save, then check the public page. This makes it easier to identify a bad change.

12 • DIGITAL ID & QR SETTINGS

This section controls the relationship between the member database, the digital card and the public verification page.

TWO IMPORTANT SWITCHES

ON ID	Allows the field to appear on the digital membership card.
PUBLIC QR	Allows the field to be exposed to a person using the public verification function.

Use the field order to control presentation. Review labels so that a non-technical verifier understands them.

QR VERIFICATION

- 1 Scan the member ID
- 2 Open the verification page
- 3 Review the public fields

Only fields marked Public QR are exposed.

A field can be useful internally without being suitable for public verification. Treat Public QR as a deliberate disclosure decision.

13 • SYSTEM SETTINGS

System Settings control the appearance and behaviour of important BAM outputs.

SETTING GROUPS

- **Theme:** Admin and verification visual preference.
- **Invoice:** title, logo, currency, official details, signatory and footer.
- **Letterhead:** image, numbering, signatory, signature caption, closing and footer.
- **Admin PWA:** notification title, deep link and test message.
- **Digital ID:** size, logo, backgrounds, accent and text.
- **Verification:** title, labels, public fields, QR search and messages.

SAFE CHANGE METHOD

Do not change several unrelated settings at the same time if you are troubleshooting. Keeping a small record of previous values makes recovery easier.

14 • ADMINISTRATORS & ACCESS

Administrator accounts control access to the management system.

ADD AN ADMINISTRATOR

Open **Admin** → **Administrators**. Enter the administrator name/username, email and password, then create the account.

ACCESS RULES

- Give access only to people who need it.
- Prefer separate accounts instead of sharing one login.
- Use unique passwords.
- Never place credentials in screenshots or public documents.
- Log out on shared computers.

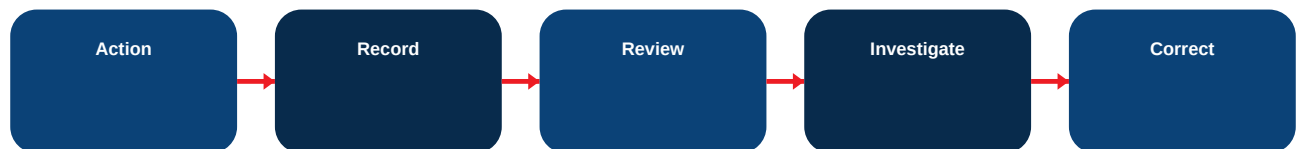

The project includes an Admin PWA and notification controls. Those are additional conveniences; they do not replace good account security.

15 • AUDIT LOG & ACCOUNTABILITY

The Activity Audit Log provides a record of important administrative actions.

WHY IT MATTERS

When a record changes, the audit trail can help an authorised administrator understand what happened and when. It is especially useful when more than one administrator operates the system.

An audit log is not a backup. It can explain a change but cannot, by itself, restore deleted database information.

16 • ADMIN PWA & NOTIFICATIONS

The Admin area includes Progressive Web App support, including a manifest, service worker, icons and offline page.

HTTPS is strongly recommended and is required by browsers for normal service-worker/PWA behaviour outside localhost.

If installation does not appear, check HTTPS first, then confirm that the manifest and service worker load correctly and that the browser supports installation.

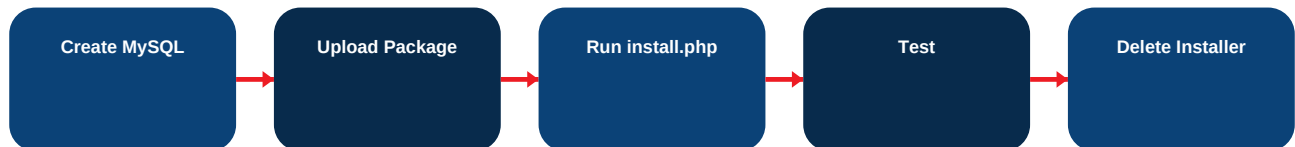

Notifications are also browser/device dependent. Permission must be granted and the device must support the required notification behaviour.

17 • INSTALLATION & DEPLOYMENT

This chapter is for the person who installs or migrates the BAM website.

SERVER REQUIREMENTS

PHP 8.0+ • MySQL 5.7+/8+ or compatible MariaDB • PDO MySQL • HTTPS/SSL • PHP file uploads • fileinfo recommended • writable uploads/ and logs/

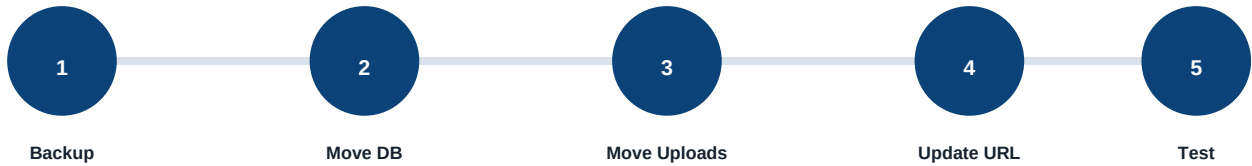

FRESH INSTALLATION

1. Create a new MySQL database.
2. Upload the package contents to the domain document root.
3. Open **<https://YOUR-DOMAIN.COM/install.php>**.
4. Enter website URL, MySQL host/port/database/user/password and first administrator details.
5. Run the installer.
6. Test public site, Admin, member login, IDs and verification.
7. Delete **install.php**.

The installer creates the tables, settings and first administrator and writes database credentials to config/config.php. Do not manually import the SQL schema first for a normal fresh installation.

18 • MOVING AN EXISTING BAM INSTALLATION

A production system with real members, invoices, letters and settings should be treated differently from a fresh install.

MIGRATION CHECKLIST

- ✓ Back up the existing database
- ✓ Back up uploads/
- ✓ Move the existing database rather than replacing it with an empty schema
- ✓ Preserve/configure config.php credentials
- ✓ Update APP_URL for the new domain
- ✓ Test Admin login
- ✓ Test member verification
- ✓ Test digital IDs
- ✓ Test invoices and letters
- ✓ Switch DNS only after the new server passes testing

Do not overwrite a production database with a fresh Version 1 schema just because the new server contains a clean package.

19 • SECURITY & DATA PROTECTION

The system contains member identity and operational information. Security is therefore part of daily administration, not only a server task.

ESSENTIAL CHECKLIST

- ✓ HTTPS enabled
- ✓ install.php removed after deployment
- ✓ config/config.php protected
- ✓ strong database password
- ✓ unique administrator credentials
- ✓ uploads protected from script execution
- ✓ regular database backups
- ✓ PHP/server kept updated
- ✓ old deployment credentials removed

BACKUP WHAT MATTERS

At minimum, back up the MySQL database and **uploads/**. A full disaster-recovery backup should also preserve the application files and the configuration needed to rebuild the service securely.

GOOD PRACTICE

Keep at least one backup separate from the live server. Periodically perform a restore test; a backup that has never been tested should not be assumed to be recoverable.

20 • TROUBLESHOOTING

When something fails, start with the simplest explanation and work outward.

SYMPTOM	FIRST CHECKS
Admin login fails	Check administrator email, account existence and password. Confirm the server can connect to the database.
Member login fails	Check Member ID, password and that the member record exists.
Digital ID is wrong	Correct the member record first, then reopen the ID. Check ID field settings.
QR verification fails	Check the member ID/QR target, member record and public verification settings.
Invoice is wrong	Reopen the saved bill and verify client details, line items, tax and Invoice Settings.
Letter is wrong	Reopen the saved letter and check recipient, body, signatory and Letterhead Settings.
Website change not visible	Confirm the edit was saved, refresh the page and check browser cache.
PWA does not install	Check HTTPS, browser support, manifest and service worker.
500 error	Check PHP/server error logs, PHP version, database connection and permissions. Do not expose credentials.

21 • DAILY ADMINISTRATION SOP

A repeatable routine reduces mistakes and makes the system easier for more than one administrator to operate.

START OF DAY

- Check upcoming events and assignments.
- Review urgent admin notifications.
- Check whether any membership changes need action.

DURING THE DAY

- Create/update member records when approved information changes.
- Record new events before deployment where possible.
- Create invoices and letters from the system rather than editing old PDFs manually.
- Verify important digital IDs after member changes.

END OF DAY

- Save all pending work.
- Review important operational records.
- Log out of Admin on shared devices.

22 • WEEKLY & MONTHLY CHECKS

WEEKLY

- Review member validity/expiry dates.
- Review recent member additions/edits.
- Review event history and personnel deployment.
- Check public website information.
- Review audit activity for unusual changes.

MONTHLY

- Verify database backup exists.
- Verify uploads backup exists.
- Review administrator accounts.
- Test QR verification.
- Test member digital ID printing.
- Test invoice PDF output.
- Test letterhead/PDF output.
- Review server/PHP update status.

QUARTERLY / BEFORE A MAJOR CHANGE

- Perform a restore test from backup.
- Review public verification fields.
- Review administrator access.
- Record important configuration values before making large changes.

23 • ONE-PAGE QUICK REFERENCE

IF YOU NEED TO...	GO HERE
Add or edit a member	Admin → Members
Open a member ID	Members → ID
Create an event	Admin → Events
Create a bill	Admin → Invoices
Create an official letter	Admin → Letters
Change public website content	Admin → Frontend Editor
Change digital ID fields	Admin → ID Fields / Settings
Change verification fields	Admin → Verification Settings
Add an administrator	Admin → Administrators
Review changes	Admin → Audit
Verify a member publicly	/verify.php
Member login	/member/login.php
Admin login	/admin/login.php

Remember: Member record → Digital ID → QR Verification is the core identity chain.

24 • SIMPLE GLOSSARY

Admin: private management area for authorised administrators.

Audit Log: record of important administrative actions.

BAM Member ID: unique identifier assigned to a member.

Digital ID: electronic membership card generated from the member record.

QR Verification: public mechanism for checking a digital ID/member record.

Frontend Editor: admin tool for changing public website content.

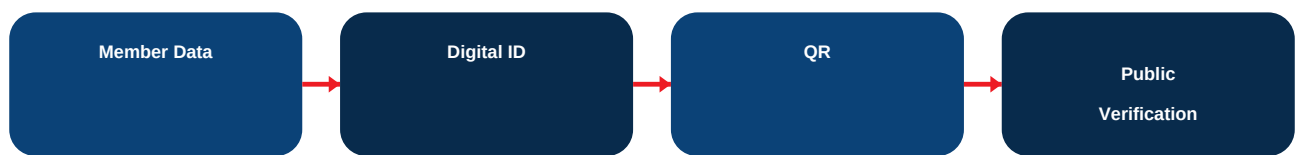

PWA: Progressive Web App support that lets the Admin area behave more like an installed app.

APP_URL: configured base URL of the BAM installation.

PDO MySQL: PHP database driver used by the application.

Uploads: directory containing uploaded files such as member photos and managed media.

THE BIG PICTURE

Once this chain is understood, most identity-related tasks become straightforward.

25 • RELEASE NOTES & MANUAL CONTROL

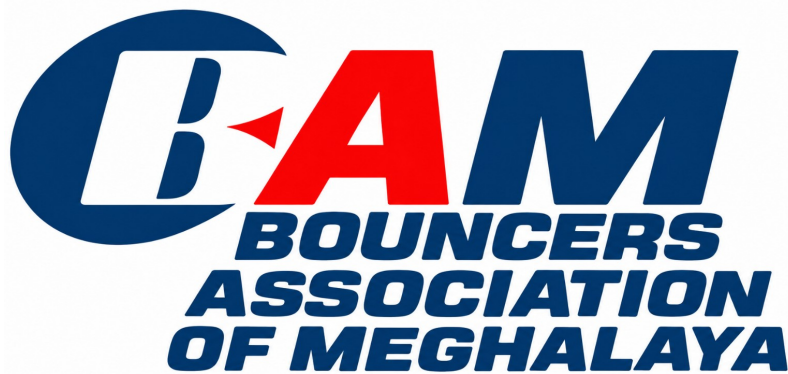

Manual edition: **Professional Blue Edition • Version 1**

Software covered: **BAM Security Website Version 1**

This manual reflects the supplied Version 1 project structure, README and project assets. If the software changes, this manual should be revised alongside the release.

DOCUMENT CONTROL

Item	Value
Organisation	Bouncer Association of Meghalaya (BAM)
Manual edition	Professional Blue Edition
Software release	Version 1
Primary audience	Public users, members, administrators and site operators
Brand system	BAM Blue + BAM Red accent
Core stack	PHP + MySQL + HTML5 + CSS3 + JavaScript

BAM SECURITY WEBSITE • PROFESSIONAL BLUE EDITION
